PART 1

Read the text. Fill in each gap with ONE word. You must use a word which is somewhere in the rest of the text.

A little girl named Ashley lived with her mom and dad. They lived on the top of a hill in a big house. The **Q1**_____ had five rooms. Ashley loved to cook and bake. She loved to make biscuits, and she **Q2**_____ to make cookies. She loved to bake for her grandmother. Every day she wore a little blue hat on her head. It was a bonnet. Wearing the **Q3**_____, she made cookies and muffins for her grandmother. The people in the town started to call her "Little Blue Bonnet." One day she was late to grandmother's house to give her the cookies and **Q4**_____. She ran into the woods to take a shortcut. She had a feeling that someone was following her. It was a wolf who wanted her cookies, and he wanted her muffins. The **Q5**_____ also wanted to eat her. The wolf got to the grandmother's house before Little Blue Bonnet. He quickly put on the grandmother's clothes. Little Blue Bonnet finally made it to her grandmother's house. She knocked on the door. The **Q6**_____ slowly opened

PART 2

Read the texts 7-14 and the statements A-J. Decide which text matches with the situation described in the statements. Each statement can be used ONCE only. There are TWO extra statements which you do not need to use.
Mark your answers on the answer sheet.

A) Your friend needs a phone and a laptop to drive this car.
B) You can easily connect your iPhone and Samsung phone to this machine.
C) You need a car that doesn't run on gasoline and can go far.
D) This modern car has the most intelligent speed limit system and audio-video devices.
E) Your eighteen-year-old brother, who just got his license to ride a car, will definitely like this electric car.
F) You need a vehicle with a lot of space for you, your life partner and children.
G) You are a big business owner and you need a luxury vehicle.
H) This family car is good at saving fuel.
I) This affordable and compact crossover can be powered by both electricity and gasoline.
J) This strong car has a spacious interior and a powerful engine

@Multilevel_Halikulov

7

🚗 **UzAuto Motors – CHEVROLET COBALT**
• Reliable sedan for families and city life
• Fuel-efficient engine with low maintenance cost
• Comfortable interior and large luggage space
• Available with installment plans at official dealers
📞 78 141 77 77 | 🌐 www.uzautomotors.com

8

⚡ **BYD SEAL EV**
• 100% electric car with 700 km range
• Fast charging: 30 minutes for 80% battery
• Modern design with panoramic sunroof
• Intelligent safety system & autopilot mode
📍 BYD Showroom Tashkent | 🌐 www.byd.uz

9

🚙 **LADA VESTA CROSS**
• Strong and affordable Russian crossover
• High ground clearance for any road in Uzbekistan
• Spacious cabin and durable engine
• Ideal balance of price and quality
📞 +998 71 200 22 11 | 🌐 www.lada.uz

10

🔥 **HAVAL JOLION**
• Stylish Chinese SUV with advanced technology
• Smart multimedia system and adaptive cruise control
• Powerful turbo engine, perfect for long trips
• 7-year warranty included!
📍 HAVAL Center Tashkent | ☎ +998 90 800 88 88

11

🌟 **TOYOTA CAMRY**
• Legendary Japanese sedan – comfort & prestige
• Hybrid technology for fuel efficiency
• Luxurious interior with advanced safety features
• A favorite choice of business leaders worldwide
📞 Toyota Uzbekistan Hotline: 78 120 12 12 | 🌐 www.toyota.uz

12

🚗 **UzAuto Motors – CHEVROLET TRACKER**
• Compact SUV for modern families
• Economical fuel consumption
• Equipped with Wi-Fi hotspot & touchscreen navigation
• Available in multiple colors at official dealerships
📍 Visit nearest UzAuto showroom

13

🚗 **UzAuto Motors – CHEVROLET ONIX**
• Smart sedan with modern design
• Equipped with turbo engine and Start/Stop system
• Touchscreen multimedia with Apple CarPlay & Android Auto
• Great balance of performance and fuel efficiency
📍 Official Chevrolet Dealer | ☎ 78 141 77 77

14

⚡ **BYD DOLPHIN EV**
• Compact electric hatchback.
• 400 km driving range per charge
• Digital dashboard and intelligent driving assistant
• Perfect for city commuting and young drivers
📍 BYD Showroom Tashkent | 🌐 www.byd.uz

PART 3

Read the text and choose the correct heading for each paragraph from the list of headings below.
There are more headings than paragraphs, so you will not use all of them. You cannot use any heading more than once.

List of Headings:

A) The role of the processor
B) How smartphones connect us
C) The importance of battery life
D) Cameras and image capture
E) Touchscreen technology
F) Protecting your personal data
G) The design and materials
H) Apps and their functions

15. Paragraph I
16. Paragraph II
17. Paragraph III
18. Paragraph IV
19. Paragraph V
20. Paragraph VI

How modern smartphones work

I. Modern smartphones are designed to be sleek, lightweight, and durable. Most use materials like aluminum, glass, or plastic to create a stylish yet strong outer shell. The design isn't just about looks—it also protects the internal components from damage. Some phones are even water-resistant, allowing users to take calls in the rain or accidentally drop their device in water without serious harm. Manufacturers carefully choose materials that balance weight, strength, and cost, while also considering how the phone feels in the hand.

II. At the heart of every smartphone is a powerful processor, often referred to as the "chip." This tiny but complex piece of hardware controls everything—from opening apps and browsing the internet to playing videos and managing memory. The processor works with other components like RAM and storage to ensure smooth performance. Faster processors allow users to multitask easily and enjoy high-quality games or videos without delays. In short, the processor is the brain that keeps the smartphone running efficiently.

III. Smartphones allow people to stay connected wherever they go. Thanks to mobile networks, users can make calls, send texts, and use mobile data to

@Multilevel_Halikulov

access the internet. Wi-Fi connections offer even faster speeds at home, work, or public places. Bluetooth lets users connect wirelessly to headphones, speakers, and other devices. GPS helps with navigation, showing real-time directions and location tracking. These features make smartphones essential tools for communication, travel, and daily life

IV. The touchscreen is one of the most important parts of a smartphone. It allows users to interact with the device using simple gestures like tapping, swiping, or pinching. Beneath the glass surface is a layer that senses touch and sends signals to the processor. This technology makes smartphones easy to use and highly responsive. Whether typing a message, playing a game, or zooming in on a photo, the touchscreen provides a smooth and intuitive experience.

V. Smartphone cameras have improved dramatically in recent years. Many devices now include multiple lenses for wide-angle shots, close-ups, and even night photography. The camera uses sensors to capture light and convert it into digital images. Advanced software helps enhance photos by adjusting brightness, contrast, and focus. Users can also record high-definition videos and edit them directly on their phones. For many people, their smartphone has replaced traditional cameras entirely.

VI. Security is a major concern for smartphone users. These devices store sensitive information like passwords, contacts, photos, and banking details. To protect this data, smartphones use features like fingerprint scanners, facial recognition, and PIN codes. Encryption helps keep messages and files safe from hackers. Regular software updates also fix security issues and improve protection. With so much personal data on our phones, strong security features are more important than ever.

PART 4

Read the following text for question 21-29.

THE ICE AGE

The Earth is about 4.6 billion years old and there have actually been about 11 different Ice Ages. An Ice Age is a cold period in which glaciers, slowly moving sheets or masses of ice, covered much of the Earth's surface. The last ice age on Earth was called 'The Great Ice Age' occurring about 11,000 years ago. Over 1/3 of the Earth's surface was covered in ice, and the air had less carbon dioxide in it.

Two explanations are usually given as to why the ice ages occurred. One, the temperatures were so cold that it never rained, only snowed. Two, the tilt of the Earth changed and it was away from the Sun.

The land looks much different during an ice age. It is frozen and bare land which is called a tundra. Very few plants exist on a tundra since the ground is too frozen to sustain life. There are evergreen trees that grow but there is no grass or flowers, only shrubs, bushes, and moss grass. In some parts of the world there are still tundra in parts of North America, Europe, and Asia.

@Multilevel_Halikulov

Following the end of the last Ice Age there were glaciers left behind and the sheets of ice-covered rivers and valleys. The melting and the refreezing of the ice continued to occur for millions of years. Then, about 10,000 years ago the Earth began to get warmer and the remaining glaciers melted leaving lakes and valleys with a mixture of rocks and soil. However, in the higher elevations there was still ice and glaciers, including some today that were left over from the last Ice Age.

A scientist named Louis Aggasiz studied the clues of the ice age in the 1800s. He explained to other scientists that boulders they saw were left by glaciers and carrying them many miles from one area to another. The other scientists did not believe him. However, Aggasiz proved his theory because boulders the glaciers left behind were made of granite. There were no other granite boulders in the area so they had to have been brought there by the glaciers. Other things also proved his theory. There was polished bedrock, large sand and gravel piles, big valleys, and rough mountain tops, which were all formed by the movement of the glaciers during the ice age. Even though ice ages took place, there were still animals living on the Earth including the wooly mammoth, wooly rhinos, cave bears, horses, wolves, bison and reindeer. A few of them are now extinct such as the woolly mammoth, cave bear, and woolly rhino. Scientists know they existed though because there were people who painted pictures of the animals on the sides of the caves where they lived.

There have been skeletons of the animals found as well. In addition, cuts of bones have been found in these skeletons which were made by the knives of the hunters. Some of the knives the hunters used were found next to the skeletons too. People also lived during the Ice Age 35,000 years ago. The role of the men included hunting for food, and the women and children prepared the food, made clothing from the hides of animals, and built the shelters where everyone lived. When the hunters killed an animal, every part of the animal was useful. Its meat and organs were used for food. The skins were used for their clothing, blankets, and shelter. Even an animal's stomach was used for carrying water. Finally, the bones were used for needles, weapons, and different tools.

@Multilevel_Halikulov

For questions 21-24, choose the correct answer A, B, C, or D. Mark your answers on the answer sheet.

21. What is the meaning of glaciers according to the text?

A) sheets of papers
B) mass cold
C) giant moving ice
D) Earth's surface

22. Tundra …
A) doesn't exist now.
B) is not suitable for plants
C) is a frozen land but has full of plant life
D) has no trees at all

23. Ice and glaciers …
A) are growing worryingly fast
B) are only in lakes and tropic valleys
C) are mixed into soil and water now.
D) still exist today

24. When a scientist named Louis Aggasiz studied the clues of the ice age in the 1800s, …
A) He didn't find anything big
B) other scientists believed him
C) his colleagues distrusted him
D) he moved boulders that were left by other scientists

For questions 25-29, decide if the following statements agree with the information given in the text. Mark your answers on the answer sheet.

25. During the Great Ice Age, more than half of Earth's surface was covered in ice.
A) True **B)** False **C)** No Information
26. Some trees can grow in tundra regions.
A) True **B)** False **C)** No Information
27. Some animals went extinct after the Ice age.
A) True **B)** False **C)** No Information
28. Ice Age people used iron knives because they didn't freeze.
A) True **B)** False **C)** No Information
29. Ice Age hunters used some parts of animals and discarded the rest.
A) True **B)** False **C)** No Information

PART 5

Read the following text for questions 30-35.

HOW VACCINES WORK

For more than two hundred years, vaccines have been one of the most powerful tools in modern medicine. They have helped people live longer, healthier lives by preventing diseases that once killed millions. To understand how vaccines work, it is useful to first look at how the human immune system

@Multilevel_Halikulov

protects the body, what happens when a vaccine is given, and why vaccines are so important for both individuals and communities.

The human body has a defense system called the immune system. Its main job is to protect us from harmful invaders, such as viruses and bacteria. When these invaders, also known as pathogens, enter the body, the immune system recognizes them as dangerous and starts fighting. One of the most important parts of the immune system is the white blood cells. These cells move through the bloodstream and tissues, always searching for signs of infection. When they detect a virus or bacterium, some white blood cells attack and destroy the invaders directly, while others create special proteins called antibodies. Antibodies are like tiny weapons that attach to the virus or bacterium, making it easier for the body to remove it.

An important feature of the immune system is memory. After fighting an infection once, the immune system “remembers” the invader. If the same pathogen enters the body again, the immune system responds faster and more effectively, often stopping the disease before it can make a person sick. This natural memory is what vaccines use to give us protection.

A vaccine is a medical product that trains the immune system without causing the actual disease. It works by showing the body a safe version of a pathogen. This can be done in several ways. Some vaccines use pathogens that are killed so they cannot cause disease. Others use a version of the virus or bacterium that is alive but weakened. Some vaccines include only parts of the pathogen, such as proteins on its surface. In recent years, new vaccines have been made with mRNA, which gives the body instructions to make a harmless piece of the pathogen’s protein so the immune system can learn to recognize it.

When a person receives a vaccine, usually by injection, their immune system reacts as if it were facing a real infection. White blood cells create antibodies and memory cells. However, because the vaccine is not dangerous, the person does not experience the severe symptoms of the actual disease. Later, if the real pathogen tries to attack, the immune system is ready to fight it quickly.

Before vaccines existed, infectious diseases caused enormous suffering. Smallpox, for example, killed millions of people for centuries. In the 20th century alone, smallpox caused more than 300 million deaths. Thanks to vaccines, smallpox was completely eliminated in 1980, the first disease in history to be wiped out by human effort. Other diseases, such as polio, measles, and diphtheria, have also been greatly reduced by vaccination campaigns. In many countries today, children rarely see these illnesses, which were once common and deadly.

Vaccines not only protect individuals but also communities. This is because of a concept called herd immunity. When enough people are vaccinated, the disease has little chance to spread. This protects those who cannot receive vaccines, such as newborn babies or people with certain medical conditions.

Some people worry about the safety of vaccines. Like any medicine, vaccines can have side effects. These are usually mild, such as a sore arm or a slight

@Multilevel_Halikulov

fever. Serious side effects are extremely rare. Scientists and doctors carefully test vaccines before they are approved, and they continue to monitor them to make sure they remain
safe. Another question people often ask is why we sometimes need booster shots. The reason is that immune memory can fade over time. For some diseases, like measles, one or two doses are enough to provide lifelong protection. For others, like tetanus or COVID-19, booster doses may be needed to keep the immune system strong.
Vaccines are not only for children. Adults also benefit from them. For example, older people often receive vaccines against influenza or pneumonia, because their immune systems are weaker. Travelers may need vaccines before visiting certain countries where diseases such as yellow fever are present. In recent years, new technologies have made it possible to develop vaccines more quickly. The COVID-19 pandemic showed how important this can be. Scientists created safe and effective vaccines in less than a year, something that would have seemed impossible in the past. These vaccines helped reduce severe illness and death worldwide. At the same time, the pandemic also showed the challenges of vaccine distribution. In some places, vaccines were not available for everyone at the same time. This highlighted the need for global cooperation, since diseases can easily cross borders.

For questions 30-33, fill in the missing information in the numbered spaces. Write no more than ONE WORD and / or A NUMBER for each question.
The body depends on the **30**_____ system to fight against viruses and bacteria.
Once the body has already dealt with an illness, it keeps a 31_____ of the germ for the future.
By presenting only a **32**_____ form of the virus or bacterium, vaccines prepare the immune system.
When enough people are vaccinated, the wider community is protected through **33**_____ immunity.
For questions 34-35, choose the correct answer A, B, C, or D. Mark your answers on the answer sheet.

34. What is the main advantage of vaccines compared to natural infection?
A) They make the body stronger and healthier in general.
B) They train the immune system without causing serious illness.
C) They completely remove all viruses from the body forever.
D) They make antibodies work faster in every situation.

35. Why are booster shots sometimes necessary?
A) Because the first vaccine does not work at all.
B) Because the immune memory can weaken after a while

@Multilevel_Halikulov

C) Because people are more likely to get sick as they get older.
D) Because vaccines often cause strong side effects

@Multilevel_Halikulov
